

Indication classes

The diseases that react upon a treatment with DCA (or not) can be well assorted into indication groups, according to the characteristics some diseases have in common. If you are dealing with an illness that is not listed on here, you can assess the healing effect of DCA by comparing the characteristics of the disease with the attributes in the following indication classes.

Group 1: Viral inflammations with a local focus

The home games of DCA are fresh viral inflammations with a local focus. Here we find diseases as herpes, neuritis, shingles, chicken pox or new warts. We can obtain analgesia and resolve the swelling after only 12-24 hours. It is possible to heal up the main symptoms of the illness in two to three days.

Group 2: Anaerobic bacterial inflammations with a local focus

We receive very good results as well in fresh anaerobic bacterial inflammations with a local focus such as inflammation of wounds, inflammations of the urinary tract, nephritis, pyelitis or concomitant symptoms of influenza as inflammations of the urinary tract or angina. Very young bacterial inflammations react upon DCA as well as viral ones. But it is important to know that this presumes the fact, that there is no pus in the seat of disease. Pus raises the pH-value of the blood and activates different types of immune cells than macrophages - DCA stops working.

Group 3: Cancer

Over the years several cases of cancer could be healed. Cancer cells behave compatible to the immune mechanism of the unspecific immune system and build up sour local focus. But it is important to say as well that only several types of cancer react upon DCA, and that it is very helpful to work with patients, that haven't been much treated with conservative medical therapy. The process of building up metastasis can be retarded and stopped as well.

Group 4: AIDS

Some characteristic symptoms of the commencing clinical picture of AIDS can be found in-between the diseases that can be cured with DCA. We can assume a medicinal benefit of deoxycholic acid on parts of the AIDS syndrome. There are some isolated cases where some symptoms of AIDS could be cured with DCA, but there is research to be done in this field to understand the role of the unspecific immune system in the fight against AIDS. From the third stage on deoxycholic acid is totally helpless in curing this deadly disease, as the mass of the macrophage populations is eliminated by then.

Group 5: Diseases that base on a disharmony of the vegetative nervous system

As we explained before – deoxycholic acid is a bile acid, and the same time a part of our hormone system. The DCA molecule can dock on the receptors of the autonomous nervous system and cause effects on it. It is competitive to the corticoidal system and has more of a kind of a harmonizing effects on our condition. Here we can observe mainly calming effects as well as a help to the regulation of the bowel or normalization of the blood pressure – simply said opposite effects of the stress hormones.

Group 6: Diseases that cant be cured with DCA

To destroy the magic potion image of DCA once again – the most diseases that are found around the world can not be combated with our immunity vitamin. Some of these illnesses have no local focus where macrophages could cumulate like the general cold. Some do not lower the pH-value of the blood far enough like hepatitis and some have agents the unspecific immune system seems to be not really responsible for like prions or all kinds of mycosis. DCA is as well helpless if it comes to aerobic bacterial infections like pneumonia, leprosy, pestilence. Apart of that most of the diseases in the third world countries cant be fought with DCA like malaria, cholera, typhus or the yellow fever.

Group 7: Rheumatism and autoimmune diseases

DCA is problematical if it comes to cure diseases, where an overshooting immune system is the cause of the problem itself. If we treat someone with deoxycholic acid who has rheumatism, asthma or allergies, the symptoms tend to get worse for one up to two days, and then drop back to the starting condition. On the other side it gives us the possibility to heal autoimmune diseases that are residues from incompletely healed infections or rheumatism in some cases by guiding the patient through a dip of aggravation to a state of better health or even complete well-being.

Group 8: Asthma, allergies and neurodermatitis

There are some diseases, where a treatment with DCA is strictly contraindicated. In this group we find allergies, asthma, neurodermatitis, lupus erythematodes or gout. If we treat with deoxycholic acid, the symptoms of the disease raise for one or two days, and we gain no healing effect at all. To ease the symptoms of these illnesses we need the opposite hormonal substance to DCA - the corticoids. And on the other side every doctor can tell you that you have to avoid corticoids when treating a virus infection like herpes.
